

SASKATCHEWAN SEED POTATO
GROWERS ASSOCIATION INC.

Seed Potato Directory

2017-18

Northern Vigor®

The unique advantage of Saskatchewan-produced seed potatoes.

Early generation, virus-free seed potatoes;
carefully grown under irrigation with
long crop rotations in one of the most isolated
seed growing areas in North America.

SSPGA Mandate

The mandate of Saskatchewan Seed Potato Growers Association Inc. is to:

- Promote the use of high quality production techniques by industry members.
- Inform grower-members and industry stakeholders of issues of importance to the industry and to provide, where possible, educational programs for new growers.
- Promote the use of high quality, locally produced, early generation seed by Saskatchewan's commercial potato industry.
- Foster the development of export markets for Saskatchewan-grown seed potatoes.
- Keep grower-members and other stakeholders informed about seed potato regulations.
- Represent the interests of Saskatchewan seed potato growers in federal and provincial policy and program development.
- Co-operate fully with federal and provincial efforts to eradicate Bacterial Ring Rot and the control of other potato pests and pathogens.
- Promote and support industry research and development.

Assiniboine Valley Seed Potato Ltd.

Andrew Kazakoff
President

Specializing in Russet Burbank

Northern Vigor®

Saskatchewan's northern environment offers:

- Long warm days
- Short cool nights
- Timely rainfall or irrigation
- Low humidity
- Bright sunshine
- Short growing season

These climate conditions produce a characteristic in Saskatchewan-grown produce that does not occur in any other part of the world. This characteristic has become known as ***northern vigor***.

The good news is that this advantageous aspect is transferrable to producers in other areas of Canada, North America, and the world. Seed potatoes produced in Saskatchewan and grown elsewhere, offer a more vigorous plant that withstands weather and growing conditions and improves any producer's bottom line.

The Seed

- physiologically young, healthy seed
- no premature sprouting
- good size distribution
- reduced moisture loss in storage
- increased tolerance of cold, wet soils

The Plant

- greater leaf area
- slower dieback
- improved recovery from hail, frost, and insect damage

The Crop

- Increased yields especially in long season varieties and high stress environments, resulting in increased average tuber size with no sacrifice in quality

The Bottom Line

- consistent performance
- superior potato quality
- improved economic returns

For more information, visit:

Benefits of Saskatchewan Seed Potatoes

The founding members of SSPGA set high standards for seed potatoes when producers first began large-scale commercial production of potatoes. As a result, Saskatchewan-grown seed potatoes:

- Originate from pathogen-free nuclear stock.
- Are sampled by Canada Food Inspection Agency for post-harvest testing for bacterial ring rot.
- Are produced under an abbreviated generation system. Elite 3 (E3) seed has become the main class of seed produced for commercial potato production. And, E3 seed is ready for commercial planning in four years of being at the nuclear stage.

Controlling Bacterial Ring Rot

Every effort is made to prevent ring rot bacteria contamination of seed stock. The following steps contribute to reducing the risk of bacterial ring rot.

- Maintenance of pedigree records on all seed lots certified by the Canadian Food Inspection Agency.
- Records are maintained from generation to generation on all seed stock produced in Saskatchewan.
- All seed potatoes produced originate from disease-free nuclear stock.
- The limited field generation production system that has been established ensure flush-through production.
- Regular inspections are conducted for bacterial ring rot during the growing season.
- Tuber inspections occur at harvest or in the bin shortly after harvest.
- Frequent tuber inspections occur at the shipping point.
- Seed trace-backs are undertaken when bacterial ring rot is present in commercial potato production.
- Laboratory testing is undertaken on all seed lots for bacterial ring rot.
- Total rejection of all seed produced on a farm occurs when a seed lot is determined to be infected with bacterial ring rot.
- Diligent seed grower efforts that occur to prevent the introduction of bacterial ring rot include disinfecting equipment and buildings used for harvesting, handling and storage of seed potatoes.

Canadian Certification Program

Seed potato certification in Canada is a national program administered and implemented by the Canadian Food Inspection Agency (CFIA) branch of Agriculture and Agri-Food Canada. The regulatory authority for certification of seed potatoes falls under Part II of the Canada ***Seeds Regulation***.

Canada's seed potato certification program is designed to regulate varieties and the purity and health of seed stock.

- **Disease-Free Nuclear Seed:** All seed potatoes produced in Canada originate with nuclear stock that is produced under sterile conditions from tissue culture that has been subjected to laboratory tests and found to be free of disease pathogens.
- **Limited Generation:** Seed potatoes produced may only remain in the certification program for no more than seven years. The first field generation is Pre-elite, which is produced from nuclear stock. Sequentially, the seed moves downward through the classification system. This results in a *flush-through* system that minimizes the risk of disease build-up.
- **Seed Classes:** The seed classes, from highest to lowest, are:
 1. **Nuclear**—potato tissue culture material that has been laboratory tested and found to be free of all disease pathogens.
 2. **Pre-elite (PE)**—produced from nuclear stock.
 3. **Elite 1 (E1)**—produced from nuclear or PE seed stock.
 4. **Elite 2 (E2)**—produced from nuclear, PE or E1 seed stock.
 5. **Elite 3 (E3)**—produced from nuclear, PE, E1 or E2 seed stock.
 6. **Elite 4 (E4)**—produced from nuclear, PE, E1, E2 or E3 seed stock.
 7. **Foundation**—produced from nuclear, PE, E1, E2, E3 or E4 seed stock.
 8. **Certified**—produced from nuclear, PE, E1, E2, E3 or E4 seed stock.
- **Disease and Variety Purity Standards:** Disease-free seed stock and variety purity are maintained through a program consisting of multiple field inspections, laboratory testing, post-harvest testing and sound agronomic practices.

The Pre-elite, Elite 1, Elite 2, Elite 3, Elite 4, Foundation and Certified classes of seed must pass two field inspections. All field inspections occur at the most opportune time for visual detection of disease symptoms and foreign varieties in the growing plant.

The standards for certification of all classes of seed are set out in sections 47.1.1 to 47.8 of the Canada **Seeds Regulations**. The maximum levels of detectable disease in the final inspection of the main commercial classes are summarized below:

Disease	Elite 3	Elite 4	Foundation	Certified
Bacterial Ring Rot	0.00	0.0	0.0	0.0
Potato Spindle Tuber Viroid	0.00	0.0	0.0	0.0
Total All Viruses	0.20	0.3	0.5	2.0
Total of Blackleg, Wilts and viruses	0.30	0.5	1.0	2.0
Varietal Mixes	0.05	0.1	0.2	0.5

NOTE: Inspection for the purpose of certification is made either visually or through laboratory testing of samples, or both. Certification does not constitute warranty by either the Canadian Food Inspection Agency or the grower that the seed potatoes meet the applicable standards set out in section 47.1.1 to 47.8 of the Canada **Seeds Regulations**.

Post-harvest Testing

Canada Food Inspection Agency (CFIA) requires post-harvest testing to certify producers who export seed potatoes. Some SSPGA members choose to test their seed potatoes in a winter grow-out. The Hawaii grow out requires a minimum of 400 randomly-selected tubers from each qualifying seed potato lot be collected. The samples are sent to Hawaii for post-harvest testing during the Saskatchewan winter.

The primary emphasis of the post-harvest test is detection of viral infections that may have occurred during the previous growing season through transmission by insects or farm machinery. When infections of this type occur, plants may remain symptomless. However, pathogens can be carried over in the seed tuber to the next season. The post-harvest test attempts to identify where and to what extent these infections have occurred. The main diseases tested include the potato leafroll virus and the mosaic virus.

Test results may be obtained from individual growers. Saskatchewan samples have never tested positive for any disease.

Seed Identification

Bagged seed is available. The following Canadian Food Inspection Agency (CFIA) tags are used to identify the seed potato class in the bag:

- **Orange Tags**—Elite seed.
- **White Tags**—Foundation seed.
- **Blue Tags**—Certified seed.

All shipments of nuclear seed must be accompanied by a Nuclear Stock Certificate issued by the CFIA. Bulk seed sales are identified by Bulk Movement Certificates issued by the Canadian Food Inspection Agency. To be valid, tags and Bulk Movement Certificates must identify seed variety, class and certification number.

Tuber Quality Standards

All seed potato classes are subject to the same tuber standards—Canada has a single quality grade for seed potatoes. The total allowable disease and defects permitted in a graded seed potato lot are set out in section 48.1 (2) to (10) of the Regulations of the Canada *Seeds* Act. Shipping point tolerances are:

Disease or Defect	Tolerance (%)
Soft rot or wet breakdowns	0.1
Dry rot	1.0
Scab or rhizoctonia—light	10.0
Scab or rhizoctonia—moderate	5.0
Stem-end discolouration due to top-killing, frost, heat, or drought with penetration from 6–13 mm	4.0
Tubers malformed or externally damaged	2.0
Total number of tubers affected by disease and defects, not including slight scab and rhizoctonia and stem-end discolouration	5.0

In addition, there should be no more than the following levels of foreign varieties in the noted class: not more than 0.05% in Elite 3, not more than 0.1% in Elite 4, not more than 0.2% in foundation, and not more than 0.5% in certified seed potatoes.

Notice to Buyer

Limited Warranty & Limitation of Damages and Remedy

The seller warrants that any seed potatoes sold or agreed to be sold to the buyer by the seller are of the grade specified upon the tag attached to each container thereof, as required by statute, within recognized tolerances. The Inspection Certificate(s) of the Canadian Food Inspection Agency (unless superseded) shall be conclusive evidence of the purity, quality, grade or any other matter respecting such seed potatoes, and such Certificate(s) shall be binding upon the buyer and the seller. It is expressly agreed that no other warranties, conditions or representations, expressed or implied, statutory or otherwise, of merchantability, fitness for a particular purpose, productiveness, absence of disease, or otherwise, are made by the seller.

A request for re-inspection of a lot may be made within two working days after receipt of the lot, and the re-inspection shall be carried out by an inspector as soon as possible but no later than five days after receipt of the request.

Phyto Diagnostics

Company Limited

TEL: 250 655-1444

FAX: 250 655-3115

9381 Ardmore Drive
North Saanich, B.C.
V8L 5G4

Phyto Diagnostics was established in 1996 to provide diagnostic testing services for seed potato growers in Western Canada. Our staff members, former employees of Agriculture and Agri-Food Canada, have research experience in virology, immunology, plant pathology and practical diagnostics.

We are approved by the Canadian Food Inspection Agency (CFIA) to test for bacterial ring rot (BRR), potato viruses including potato mop top virus (PMTV), and potato spindle tuber viroid (PSTVd).

SERVICES OFFERED:

Bacterial Ring Rot (BRR) testing of seed potatoes.

Post-harvest virus testing - greenhouse testing and Hawaii winter tests.

Nuclear stock audits of seed potatoes: BRR, PSTVd, PVX, PVY, PVS, PVM, PVA, PLRV, PotLV & PMTV.

Development and production of monoclonal antibodies, and PCR procedures for plant virus detection.

GMO testing of seed potatoes.

Maintenance of the Western Potato Consortium tissue culture collection, including protected accessions (under Breeders Rights or U.S. Patent Legislation).

Virus eradication for newly submitted accessions.
